Supplementary Fig. 1. Illustrative case of recanalized VBDA with major branch involvement.

A, B. 64-year-old male underwent stent-assisted coil embolization for left distal VA dissecting aneurysm. Angiography post-procedure shows residual aneurismal sac filling near posterior inferior cerebellar artery. C, D. Angiography after 6 months displays more prominent residual sac filling with coil compaction (dotted arrows). VA = vertebral artery, VBDA = vertebrobasilar dissecting aneurysm
