Supplementary Fig. 2. Relationship of PTD (A) and rPTAo (B) to height in children determined using CCT images. Above figures demonstrate superimposed data points from step 4 (n = 27, black box) in text Figure 2. Only filled black boxes (n = 9) are patients in step 4 who showed mPAP > 25 mm Hg with right heart catheterization. Solid lines are threshold (> 25 mm Hg) lines created from step 3 subjects. Dash lines are best-fitting regression curves from step 2 subjects (small round circles). One filled black box on each upper figure lay below threshold line, which was reason why negative predictive value was not 100%.
