SUPPLEMENTARY MATERIALS

The maximum perpendicular length of the subtraction band artifact in each of the four quadrants on the liver surface at the level of the junction of the inferior vena cava and the hepatic veins was measured to evaluate the co-registration artifact of the subtraction image (14). The median maximum perpendicular length of the subtraction band artifact representing the co-registration artifact of subtraction magnetic resonance images was 0.8 cm in 147 patients (range, 0–3.2 cm).
